

## Pick your favourite wild berry!

Since 2020, AAFC and the Seabird Island band have been working on a co-developed project to revitalize Seabird Island community access to wild berries. In 2021 and 2022, our team screened and identified insect pests and natural enemies associated with native berries of importance to the Seabird Island community. This year we would like to continue the project by identifying sites for wild berry cultivation by predicting suitable habitat based on environmental conditions. The overall goal will be to provide information that could guide management for berry production or repopulation.

We would like to start our work with just one of your favourite wild berry species. Please help us to decide by answering the survey question below.

Which of the following native berry species would be of most interest to you? (Please circle)

- Salmonberry (elíla)
- Thimbleberry (t'qwém)
- Red Elderberry (sth'íwéq')
- Other: \_\_\_\_\_

Do you have any other feedback for us as we get started on this new part of the project?
